

I am looking forward to the 60 Meter band when it becomes available. In keeping with our traditions we should have both CW and SSB modes allowed. This will provide adequate coverage to cover various band conditions and still assure communications can get through, we must not limit ourselves to a single mode of operation.

Power limitations, in my opinion can be limited to 100 watts PEP as it has been proven this power level will provide more than adequate communication and provide a better utilization of band width and reduce the QRM.

Thank you for this opportunity,
Charles Mabbott
